TITEL	<b>Zeit Applikation (Klasse)</b>		
BESCHREIBUNG	<pre> classDiagram     class Time {         -second:int = 0         -minute:int = 0         -hour:int = 0         +Time()         +Time(second:int, minute:int, hour:int)         +getHour():int         +getMinute():int         +getSecond():int         +setHour(hour:int):void         +setMinute(minute:int):void         +setSecond(second:int):void         +toString():String         +setTime(second:int, minute:int, hour:int):void         +nextSecond():Time     }   </pre> <p>The diagram shows a UML class named 'Time'. It has three private attributes: '-second:int = 0', '-minute:int = 0', and '-hour:int = 0'. It has several public methods: '+Time()', '+Time(second:int, minute:int, hour:int)', '+getHour():int', '+getMinute():int', '+getSecond():int', '+setHour(hour:int):void', '+setMinute(minute:int):void', '+setSecond(second:int):void', '+toString():String', '+setTime(second:int, minute:int, hour:int):void', and '+nextSecond():Time'. A dashed arrow points from the '+nextSecond()' method to a callout box containing the text: "Increase by one second; and return this instance". Another dashed arrow points from the '+toString()' method to a callout box containing the text: "'hh:mm:ss' with leading zero". A third callout box contains the range of values for each attribute: 'hour: [0, 23]', 'minute: [0, 59]', and 'second: [0, 59]'.</p>		
IDEE, BEISPIEL	<p>Erstellen Sie eine Klasse Time und erstellen Sie dazu eine Testklasse in der Sie die einzelnen Methoden testen können.</p>		
SCHWIERIGKEIT	<p>A class called <code>Time</code>, which models a time instance with hour, minute and second, is designed as shown in the class diagram. It contains the following members:</p> <ul style="list-style-type: none"> <li>• 3 private Instanz <code>hour</code>, <code>minute</code>, and <code>second</code>.</li> <li>• Constructors, getters and setters.</li> <li>• A method <code>setTime()</code> to set <code>hour</code>, <code>minute</code> and <code>second</code>.</li> <li>• A <code>toString()</code> that returns "<code>hh:mm:ss</code>" with leading zero if applicable.</li> <li>• A method <code>nextSecond()</code> that advances <code>this</code> instance by one second. It returns <code>this</code> instance to support chaining (cascading) operations, e.g., <code>t1.nextSecond().nextSecond()</code>. Take note that the <code>nextSecond()</code> of <code>23:59:59</code> is <code>00:00:00</code>.</li> </ul> <p>Write the <code>Time</code> class and a test driver to test all the public methods.</p>		
SKALIERBARKEIT	<p>Input Überprüfung mit <i>Exception Handling</i></p> <pre> // Throw an exception if input is invalid public void setHour(int hour) {     if (hour &gt;= 0 &amp;&amp; hour &lt;= 23) {         this.hour = hour;     } else {         throw new IllegalArgumentException("Invalid hour!");     } }   </pre>		

	<pre>public class TestTime {     public static void main(String[] args) {         // Valid inputs         Time t1 = new Time(1, 2, 3);         System.out.println(t1);          // Invalid inputs         // Time t2 = new Time(60, 59, 12);         // program terminates abruptly         // NOT continue to the next statement          // Invalid inputs Handled gracefully via try-catch         try {             Time t3 = new Time(60, 59, 12); // throw IllegalArgumentException             // Skip the remaining statements in try, goto catch             System.out.println("This line will be skipped, if exception occurs");         } catch (IllegalArgumentException ex) {             // You have the opportunity to do something to recover from the error.             ex.printStackTrace();         }          // Continue the next statement after "try" or "catch".         System.out.println("Continue after exception!");     } }</pre>
